

Combination Probes

MINKON can provide combination probes by integrating sampling devices with temperature and oxygen cells to provide efficient and cost effective measuring systems. Often specifically designed for the application, MINKON work with the customer or engineering solution developer to optimize the product to achieve accurate and representative performance.

Accurate, Representative and Efficient.

MINKON Combination units can be supplied in all sample styles and for iron or steel: Disc, Oval, Dual-Thickness, Reversed-Dual-Thickness, Pin, etc. Various combinations of different sample designs are also available in one unit.

The advantage of a combination device is reduced cost over individual units together with improved safety as the number of immersions are reduced. Furthermore they can be incorporated into automated systems via magazines to ensure ease of application and maximize control.

For further details please contact MINKON to discuss your application requirements.
